Minnesota Valley National Wildlife Refuge Birds, Beaks and Adaptations Sept. 2011 Page 2 of 13 decide the answer together. After everyone has agreed, the ONLY team member that may answer the question is the team captain. If the team is correct, they will receive the points.

Minnesota Valley National Wildlife Refuge Birds, Beaks ...

Most swimming or paddling birds have their legs and feet located at the rear of their body. This adaptation is an advantage on the water – it helps to propel the birds along. But what's good on the water isn't necessarily good on land. Having their legs and feet located at the rear of their body makes walking more difficult for these birds.

Project Beak: Adaptations: Feet: Swimming

In fact, according to one study, these birds are the only ones whose beaks do not depend on adaptations to feeding habits, but on their size. The shape of their beaks is not very varied among the different species within this group. Bald eagle beak. By Bald eagle beak | Shutterstock.com Granivorous birds.
